

Contraindications

RapidVit™ Oocyte contains gentamicin. Do not use if patient has known hypersensitivity/allergy to the component.

Product DescriptionSUPPLEMENTED WITH HSA
RapidVit™ Oocyte contains three solutions for the verification of oocytes. The solutions are based on a modified protocol of the LAL-test (Limulus Agglutination Test) for the detection of endotoxins. The MOPS-buffered medium containing gentamicin is used as an antibacterial agent, and human serum albumin.

Vitr. 1™ Oocyte contains no cryoprotectants.

Vitr. 2™ Oocyte contains ethylene glycol and propandiol as cryoprotectants and sucrose.

For use after warming to +37°C in ambient atmosphere.

The summary of safety and clinical performance can be found at www.vitrolife.com**Storage instructions and stability**

Store in a cool, dry place until the expiry date shown on the container labels and the LOT-specific Certificate of Analysis.

Media boxes can be used for up to two weeks after first opening, use aseptic technique and minimize the time outside the refrigerator. Record opening date on the bottle. Discard excess media no later than one day after first opening.

Directions for use

The product shall be used by an IVF professional. The patient target group is an adult or reproductive-age population that undergoes IVF treatment or fertility preservation.

The following is the general procedure for using RapidVit™ Oocyte.

Note: Timing with verification procedures is critical, ensure you follow the protocol precisely.

Vitrofertilization

Place 1 ml of each of the following media into separate wells of a multi-well plate and warm to 37°C in ambient atmosphere.

• Vitr. 1 Oocyte

• Vitr. 2 Oocyte

All three types of the oocytes are carried out at 37°C (on the heated stage) in ambient atmosphere. It is very important to keep the temperature of all verification solutions at 37°C at all times. Deviations from 37°C will alter the properties of the cryoprotectants, which may compromise oocyte survival.

NOTE: The recommended oocytes should not be stored in the refrigerator for more than 24 hours, may result in remarkable changes, which could cause suboptimal oocyte survival.

RapidVit™ Oocyte has an in vitro use-by date.

Following egg retrieval oocytes should be held in an incubator at 37°C in PLG + ATC at 0% CO₂. Approximately two hours after retrieval denote the day of oocytes. If oocytes are not verified immediately after denotation, they should be transferred into Vitr. 1 Oocyte. The time of vitrification. Transfer the oocytes into Vitr. 1 Oocyte. Oocytes should remain in the solution for at least 5 minutes.

Move an appropriate number of oocytes into Vitr. 2 Oocyte. The oocytes will be exposed to this solution for 2-3 minutes. After this time, the oocytes will be rinsed off, collected and re-verified on the heated stage of the dish.

The eggs are expected to re-expand to their original volume after denotation. Deviations from 37°C will alter the properties of the cryoprotectants, which may compromise oocyte survival.

NOTE: The recommended oocytes should not be stored in the refrigerator for more than 24 hours, may result in remarkable changes, which could cause suboptimal oocyte survival.

Prepare the cryovaccine for use.

When the oocytes have fully re-expanded make two 50 µl droplets of Vitr. 2 Oocyte on a non-toxic surface, preferably a siliconized glass slide. Place the droplets onto a petri dish and add 10 µl of Vitr. 3 Oocyte enables easy loading onto the cryodewar.

Use of storage device

Use a closed storage system to prevent the potential risk of viral or other contamination of samples.

Prepare the actual verification according to the instructions for Use for the storage device.

NOTE: The 50 µl droplet can only be used once.

Transfer the oocytes in a minimal volume of Vitr. 2 Oocyte to avoid dilution of the droplets.

The oocytes are transferred into the first Vitr. 3 Oocyte. The time of vitrification. Transfer the oocytes into Vitr. 1 Oocyte. Oocytes should remain in the solution for at least 5 minutes.

Move an appropriate number of oocytes into Vitr. 2 Oocyte. The oocytes will be exposed to this solution for 2-3 minutes. After this time, the oocytes will be rinsed off, collected and re-verified on the heated stage of the dish.

The eggs are expected to re-expand to their original volume after denotation. Deviations from 37°C will alter the properties of the cryoprotectants, which may compromise oocyte survival.

NOTE: The recommended oocytes should not be stored in the refrigerator for more than 24 hours, may result in remarkable changes, which could cause suboptimal oocyte survival.

Prepare the cryovaccine for use.

When the oocytes have fully re-expanded make two 50 µl droplets of Vitr. 2 Oocyte on a non-toxic surface, preferably a siliconized glass slide. Place the droplets onto a petri dish and add 10 µl of Vitr. 3 Oocyte enables easy loading onto the cryodewar.

Use of storage device

Use a closed storage system to prevent the potential risk of viral or other contamination of samples.

Prepare the actual verification according to the instructions for Use for the storage device.

NOTE: The 50 µl droplet can only be used once.

Transfer the oocytes in a minimal volume of Vitr. 2 Oocyte to avoid dilution of the droplets.

The oocytes are transferred into the first Vitr. 3 Oocyte. The time of vitrification. Transfer the oocytes into Vitr. 1 Oocyte. Oocytes should remain in the solution for at least 5 minutes.

Move an appropriate number of oocytes into Vitr. 2 Oocyte. The oocytes will be exposed to this solution for 2-3 minutes. After this time, the oocytes will be rinsed off, collected and re-verified on the heated stage of the dish.

The eggs are expected to re-expand to their original volume after denotation. Deviations from 37°C will alter the properties of the cryoprotectants, which may compromise oocyte survival.

NOTE: The recommended oocytes should not be stored in the refrigerator for more than 24 hours, may result in remarkable changes, which could cause suboptimal oocyte survival.

Prepare the cryovaccine for use.

When the oocytes have fully re-expanded make two 50 µl droplets of Vitr. 2 Oocyte on a non-toxic surface, preferably a siliconized glass slide. Place the droplets onto a petri dish and add 10 µl of Vitr. 3 Oocyte enables easy loading onto the cryodewar.

Use of storage device

Use a closed storage system to prevent the potential risk of viral or other contamination of samples.

Prepare the actual verification according to the instructions for Use for the storage device.

NOTE: The 50 µl droplet can only be used once.

Transfer the oocytes in a minimal volume of Vitr. 2 Oocyte to avoid dilution of the droplets.

Use of storage device

penetrano nell'ovocita e quindi l'espansione. Preparare il criste-disposito per l'uso.

Dopo che il ovario ha finito di riprodursi, mettere il vaso di Vitr 3 Oocyte su una superficie non tossica, preferibilmente una piastra di cottura. Gocce piccole di Vitr 3 Oocyte consentono un facile controllo.

Utilizzo di dispositivi di conservazione

Utilizzare dispositivo di conservazione destillato all'uso nelle procedure di vitrificazione di oociti umani, per assicurare livelli di ricadimento e raffreddamento sufficienti.

Utilizzare un sistema di conservazione chiuso per evitare perdite di refrigerante o contaminazione virale o altri tipi di danni.

Eseguire la vitrificazione e il riscaldamento secondo le istruzioni per il dispositivo del conservatore.

NOTA: la goccia di 50 µl può essere usata solta. Trasferire gli oociti in un volume minimo di 50 µl di Vitr 3 Oocyte per evitare la diluizione.

Trasferire gli oociti nella prima goccia di Vitr 3 Oocyte.

Svitolare la pipetta all'esterno della goccia e adescare nuovamente la pipetta dalla seconda goccia. Tuttavia immettere gli oociti nella seconda goccia di Vitr 3 Oocyte.

NOTA: il tempo totale che intercorre tra il trasferimento degli oociti nella goccia di Vitr 3 Oocyte e la vitrificazione degli oociti deve essere compreso tra 25 e 35 secondi.

Vitrificare immediatamente oociti secondo le istruzioni del dispositivo.

Continuare la conservazione secondo le pratiche dei laboratori.

Dati tecnici

Filtrato di mediale

Analisi su embrioni di topo. 1 cellula (% embrioni sviluppati in blastocisti espanso a 96 ore) < 80

< 0,5 Endotossine batteriche analisi (LAL) [EU/mL]

pH testato

Osmolalità testata

Precrizione

La sicurezza a lungo termine della vitrificazione sui bambini nati secondo questo metodo di conservazione è ancora da stabilire.

I dati di bassissima incidenza e tossicità della sferulite del terreno IVF, inclusi i termini IVF e ICSI, non sono stati determinati e sono incerti.

La sicurezza e l'efficacia dell'utilizzo di questo metodo di conservazione degli oociti umani è stata confermata da molti studi.

Eliminare il rischio di integrazione del fisiologico (confezione sterile) è compromessa. Non utilizzare RapidVit Oocyte se presenta un aspetto torbido.

RapidVit Oocyte contiene albumina serica umana.

Altrimenti, si consiglia di utilizzare albumina ricavata come potenzialmente infettiva. Le prime maternità impegnate per questi prodotti sono risultate negative al test per virus, retinite, virus della papillomatosi genitale e il test negativo per HbsAg, HCV RNA e HIV-1 e sifilide. Nessun metodo di prova può garantire che i prodotti siano dal sanguino umano non trasmisibili agenti infettivi.

Per evitare contaminazioni, Vitrificare raccomanda di apprezzare e utilizzare il protocollo esclusivamente con tecniche di laboratorio.

Segnalare al produttore e all'autorità competente dello Stato membro cui risiede gli utenti o i pazienti eventuali incidenti gravi che si sono verificati in relazione al dispositivo.

Non per iniezione.

Smaltire il prodotto secondo la pratica clinica standard per i rifiuti medici periodici per le temute della procedura.

Attenzione: La legge federale (degli Stati Uniti) limita la vendita di questo dispositivo medico perché prescritto da un dottore o un professionista esperto del suo utilizzo (Rx only).

II: Naujodis informacija

Zmogus oociti (MII) vitrifikacijos terp.

Kontraudikacijos

"RapidVit Oocyte" sudėtys yra gentamicina.

Nenaudoku patikimai, kuriamas rūpesčiai padidėja jautrumas ar alergija sudedamajai medžiagai.
