Rapid-i vitrification of oocytes

For detailed information, consult the Instructions for use for RapidVit Oocyte, RapidWarm Oocyte and Rapid-i Kit

Vitrification should only be performed by staff trained in vitrification procedures. Ensure you follow the protocol precisely. The timeframes are critical. The recommended volumes should not be changed. Volume changes will affect temperature control as well as osmolality, which may give suboptimal results. All procedures should be performed on a heated stage (solutions at 37 °C) and ambient atmosphere.

Step 1 Prepare

- RapidVit™ Oocyte
- Rapid-i™ Kit
- SmartBox™
- Vitrolife™ 5-well culture dish
- Rapid-i™ Sealer
- Rapid-i™ CryoCane
- Rapid-i™ Goblet

Fill the SmartBox with liquid nitrogen up to 1 cm from the box’s rim and place the lid on top of the box. Always maintain a sufficient level of liquid nitrogen in the SmartBox.

Step 2 Expose to Vitri 1 Oocyte

Transfer the oocytes into Vitri 1 Oocyte and leave for 5-20 minutes.

Vitri 1 Oocyte: 5-20 minutes

Step 3 Expose to Vitri 2 Oocyte

Before moving an appropriate number of oocytes, prime the micro-pipette with Vitri 2 Oocyte.

Pick up the oocytes with minimal volume to avoid dilution.

Transfer the oocytes into Vitri 2 Oocyte and ensure complete exposure. Keep the lid on whenever applicable.

Vitri 2 Oocyte: 2-5 minutes

Step 4 Expose to Vitri 3 Oocyte

Prime the micro-pipette with Vitri 3 Oocyte.

Pick up the oocytes with minimal volume to avoid dilution.

Transfer the oocytes into the first Vitri 3 Oocyte droplet.

Empty the micro-pipette outside the droplet and prime again from the second droplet.

Immediately transfer the oocytes to the second Vitri 3 Oocyte droplet.

The total exposure time, from entering Vitri 3 Oocyte until vitrification, should be 25-35 seconds.

Vitri 3 Oocyte: 25-35 seconds

Step 5 Load the Rapid-i

Before loading the oocytes on the Rapid-i, remove the metal rod from the RapidStraw and discard. Position the Rapid-i next to the Vitri 3 Oocyte droplets.

Collect the oocytes with the micro-pipette. Keep them close together at the tip of the pipette.

Load the oocytes into the Rapid-i hole, without overfilling or underfilling.

Step 6 Vitrify and seal

Immediately after loading, place the Rapid-i into the pre-cooled RapidStraw in the SmartBox.

Cover the RapidStraw opening with your hand for a few seconds to prevent that the Rapid-i pops out.

Seal the top of the RapidStraw using the Rapid-i Sealer.

Inspect the seal to ensure that sealing was correctly performed.

Step 7 Store

Place the Rapid-i CryoCane with attached Rapid-i Goblet in the SmartBox.

Move the RapidStraw into the Rapid-i Goblet. The lowest black mark of the RapidStraw must always be submerged in liquid nitrogen.

Transfer to long term storage according to laboratory practice.

Correct handling or sealing of the RapidStraw can cause a pressure build up inside that may result in damage or even explosion of the straw during the warming procedure.

Incorrect handling or sealing of the RapidStraw can cause a pressure build up inside that may result in damage or even explosion of the straw during the warming procedure.

The sealed RapidStraw may never be removed from liquid nitrogen.

Pre-caution: Discard product if bottle integrity is compromised. Do not use if solution appears cloudy. Ensure Rapid-i Kit packaging is intact and use by date has not expired. Ensure Rapid-i is intact before starting procedure.
Rapid-i warming of oocytes

For detailed information, consult the Instructions for use for RapidVit Oocyte, RapidWarm Oocyte and Rapid-i Kit

**Step 1 Prepare**
- RapidWarm™ Oocyte
- SmartBox™
- Vitrolife™ 5-well culture dish
- Rapid-i™ Cutter
- Rapid-i™ Forceps

Fill the SmartBox with liquid nitrogen up to 1 cm from the box's rim and place the lid on top of the box. Always maintain a sufficient level of liquid nitrogen in the SmartBox.

Place 1 ml of each Warm Oocyte solution into a Vitrolife 5-well culture dish.

**Step 2 Move RapidStraw to SmartBox**
Collect the oocytes from long term storage.
Place the Rapid-i CryoCane with Rapid-i Goblet and the RapidStraw in the SmartBox.
Remove the RapidStraw from the Rapid-i Goblet and place it in the slit of the lid where the magnet is located.

**Step 3 Open RapidStraw**
Hold the RapidStraw with your fingertips.
Cut the RapidStraw just above the black tab of the Rapid-i, using the Rapid-i Cutter.
Lift the Rapid-i out of the RapidStraw using the Rapid-i Forceps, just enough to grasp the end with your fingertips.

Ensure that RapidStraw is opened by cutting, before it is removed from liquid nitrogen.

**Step 4 Expose to Warm 1 Oocyte**
Quickly (within 1 second) but carefully, move the Rapid-i and plunge it into Warm 1 Oocyte.
Verify that the oocytes are released in the medium and then remove the Rapid-i.
The total exposure time, from plunging the samples into Warm 1 Oocyte, should be 1 minute.

**Step 5 Expose to Warm 2 Oocyte**
Pick up the oocytes with minimal volume to avoid dilution.
Transfer the oocytes into Warm 2 Oocyte and leave for 3 minutes.

**Step 6 Expose to Warm 3 Oocyte**
Pick up the oocytes with minimal volume to avoid dilution.
Transfer the oocytes into Warm 3 Oocyte and leave for 5 minutes.

**Step 7 Expose to Warm 4 Oocyte**
Pick up the oocytes with minimal volume to avoid dilution.
Transfer the oocytes into Warm 4 Oocyte and leave for 5–10 minutes.

Rinse the oocytes in culture medium several times.
Culture according to laboratory practice.

Precaution: Discard product if bottle integrity is compromised. Do not use if solution appears cloudy.
